

---

# The benefits of getting Soil Fertility Right

---

**Stan Lalor and David Wall**

Teagasc, Johnstown Castle

Irish Grassland Association  
Dairy Conference  
Clonmel Park Hotel  
8 January 2013

# Outline – Key Questions

---

- What's happening to soil fertility ?
- What steps can be followed to manage it ?
- What are the benefits ?
  - Is there a return on investment to managing / improving fertility ?
- What Targets can be set for soil fertility ?

# Soil pH – Grassland soils

## Soil pH

### Dairy Farms

(Mean No. of samples = 13200 per year)

■ Grassland target = 6.2-6.3

■ 60% of grassland soils with pH < 6.0

■ Liming is very important

# Soil Test P & K – National

## Soil P - Dairy Farms All Counties

(Mean No. of samples = 13400 per year )

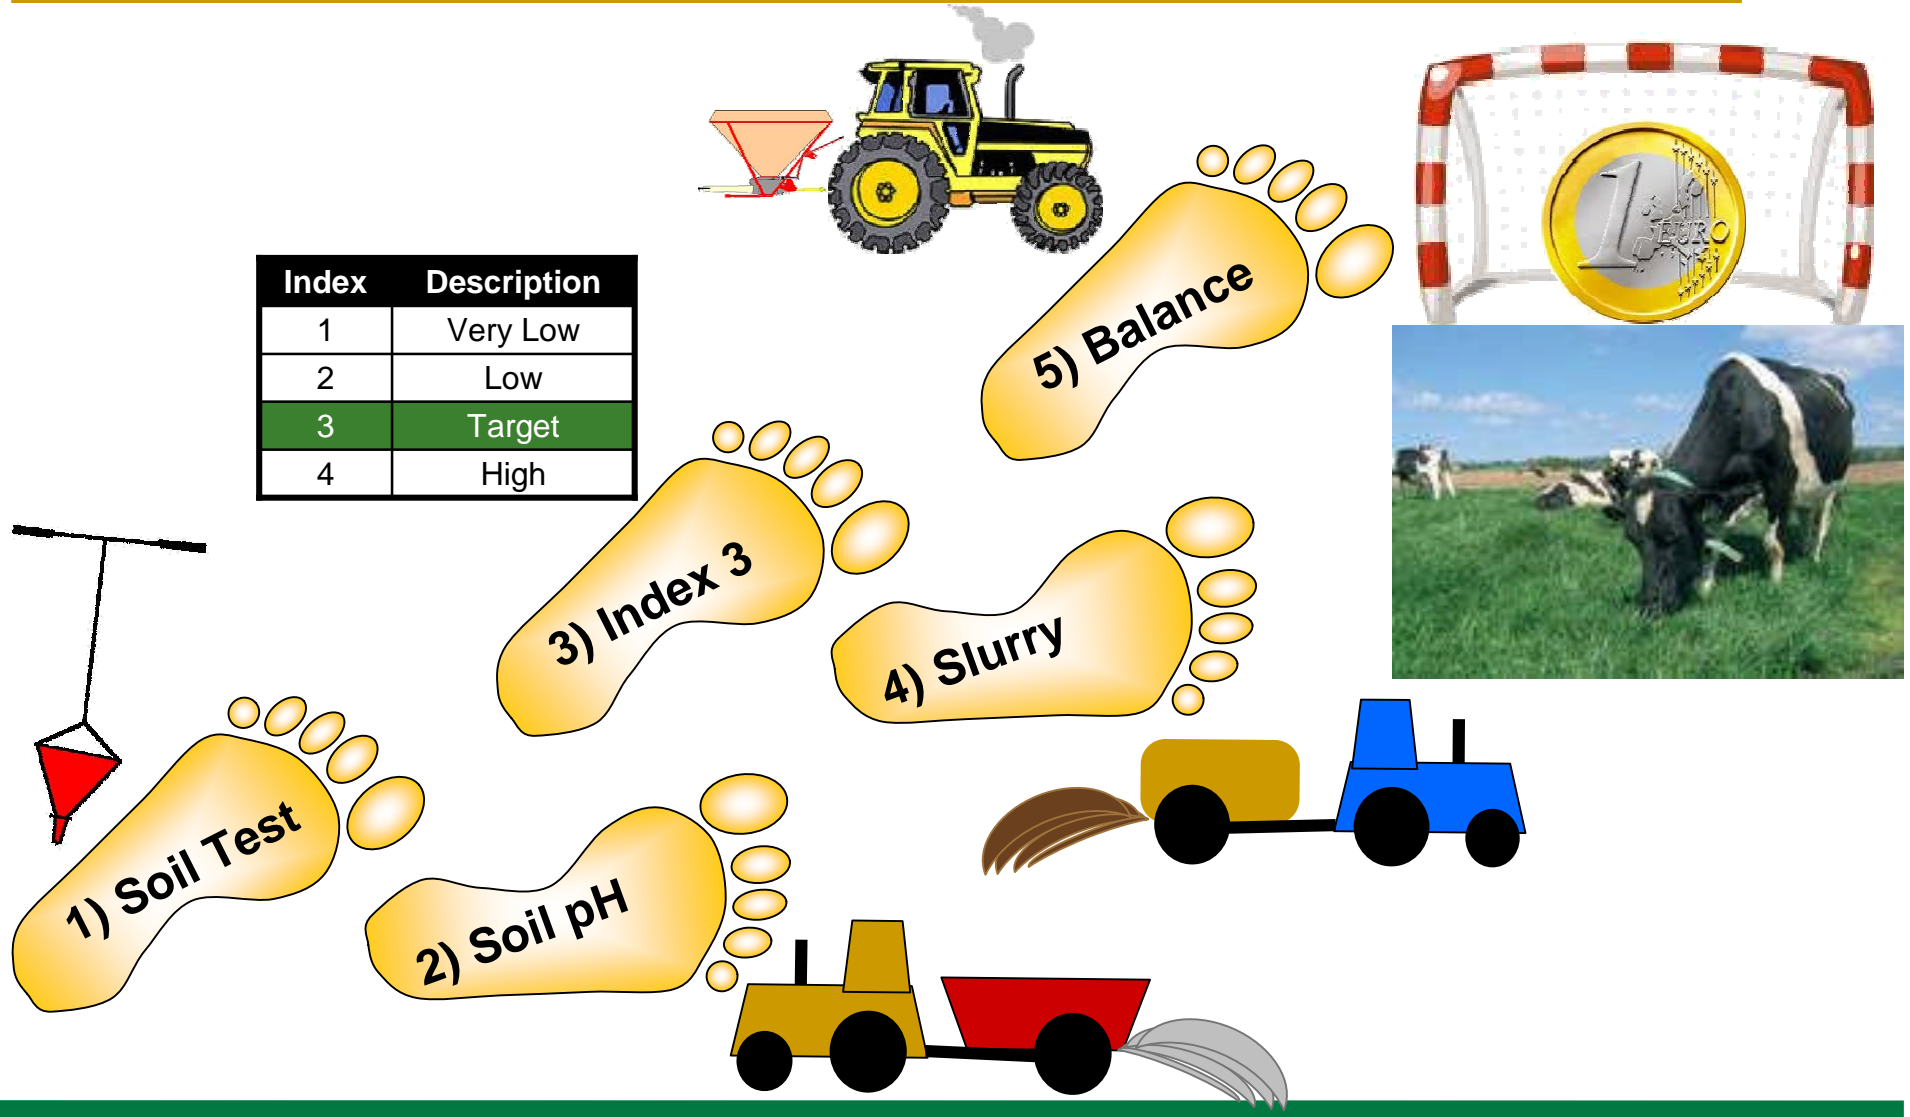

- Potassium (K) shows similar trend

- What does this mean for you?

- 25 % of soils are in Index 3
- If you don't soil test, you don't know what you are dealing with
- Are your soil fertility levels declining as well?

# Steps to Soil Fertility Management

Index	Description
1	Very Low
2	Low
3	Target
4	High

# Steps to Soil Fertility Management

# Soil Testing – Why?

---

- Indicator of background soil fertility levels
  - Soil pH and Lime requirement
  - P & K
  - Mg and trace elements
  
- Tool to help plan nutrient applications
  - Fertilizer
  - Slurry / FYM
  
- Monitor change in soil fertility levels overtime
  - Adjust fertilizer / manure management practices
  
- Derogation requirement

# Soil Testing – Why?

- Indicator of background soil fertility levels

- Soil pH and Lime requirement
- P & K
- Mg and trace elements

## Recent Survey –

Only 41% of samples are used for fertilizer planning  
Mainly used only for cross-compliance

- Tool to help plan nutrient applications

- Fertilizer
- Slurry / FYM

- Monitor change in soil fertility levels overtime

- Adjust fertilizer / manure management practices

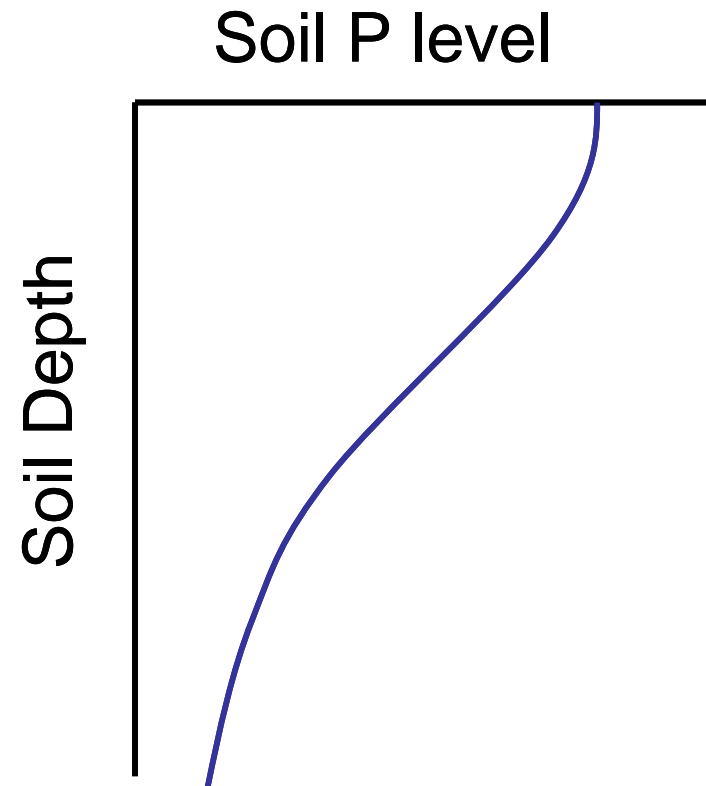

- Derogation requirements

**Soil Test for yourself  
- Not for the Inspector !!!!!**

# Soil Testing – How?

- Area: one sample per 2-4 ha (5 ha with derogation)
  - Soil type; slope; cropping history; drainage; experience
  - Practical management units
- Sampling pattern:
  - Representative sample from entire field
  - Avoid unusual spots  
(Gates, Feeders, ditches, dung/urine patches, FYM heaps)
- Depth
  - Full 10 cm depth is critical

# Soil Testing – When?

## ■ How often:

- Every 3-5 years (4 years if in derogation)

## ■ Timing:

- For comparison, sample at same of year
- Avoid extremes (Very dry / waterlogged)
- Late Autumn / Early Spring ideal
  - Results ready for fertilizer planning for the coming year

Fertilizer P & K  
3-6 months

Slurry / FYM  
3-6 months

Lime  
2 years  
(for accurate soil pH)

# Steps to Soil Fertility Management

# Soil pH and Liming

- Optimum pH for grassland = 6.2 - 6.3

- Maximum nutrient release from soils
- Soil biological activity

- 60% of grassland soil < 6.0

- Response to fertilizer P on acid soils ????

**Priority**

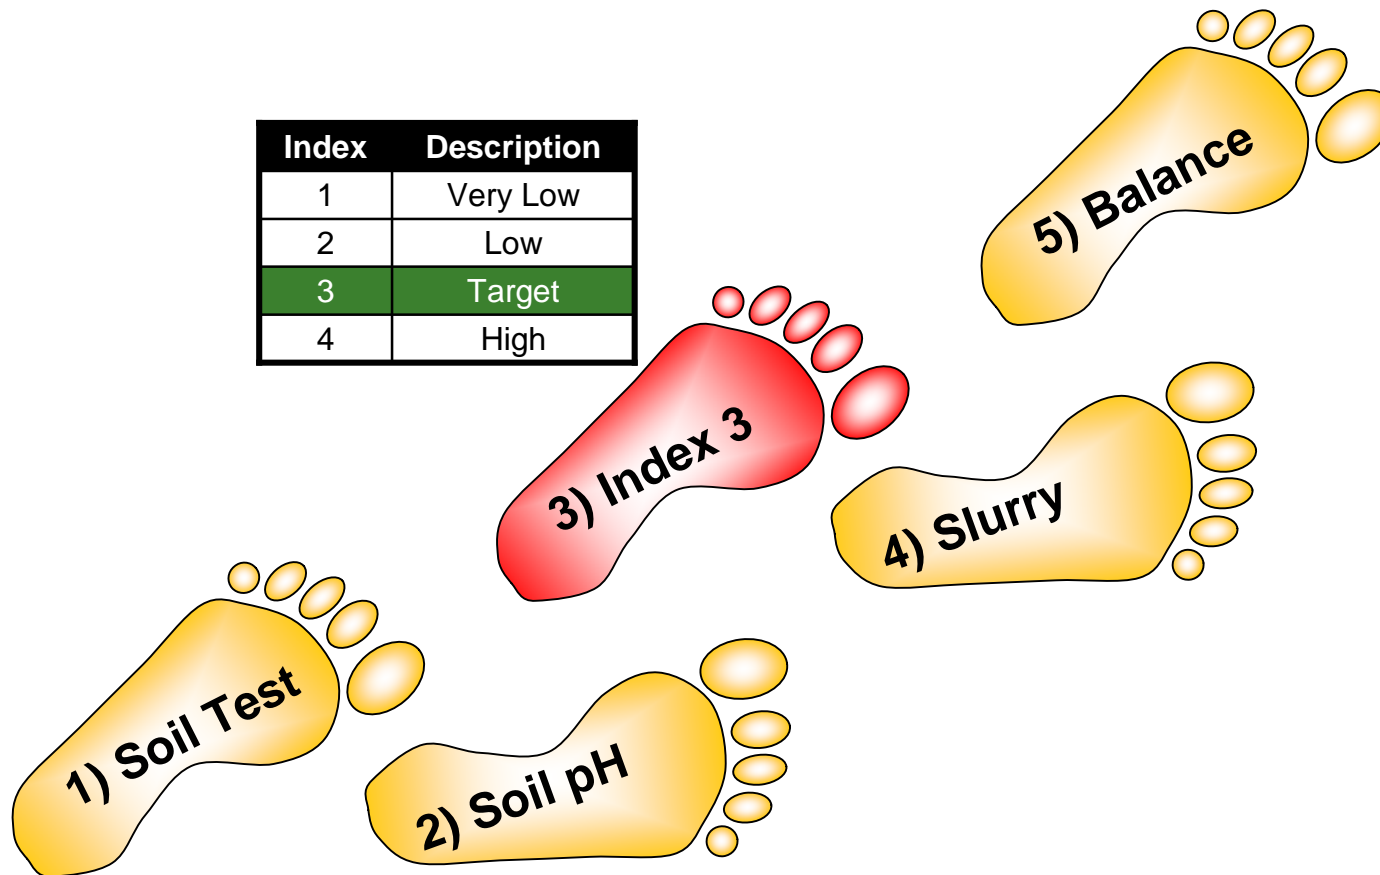

# Lime requirements

---

- Advice is to apply lime in a 3-5 year cycle
  - Grassland typically requires between 0.5 - 1 t/ha/yr
  
- Exceptions
  - High Mo soils and grassland → don't exceed pH 6.2
    - Lime requirements reduced by 5 t/ha
  - Where advice is > 7.5 t/ha
    - Split application
    - 7.5 t/ha now
    - Remainder after 2 years
    - Precaution to reduce risk of trace element problems

# Steps to Soil Fertility Management

Index	Description
1	Very Low
2	Low
3	Target
4	High

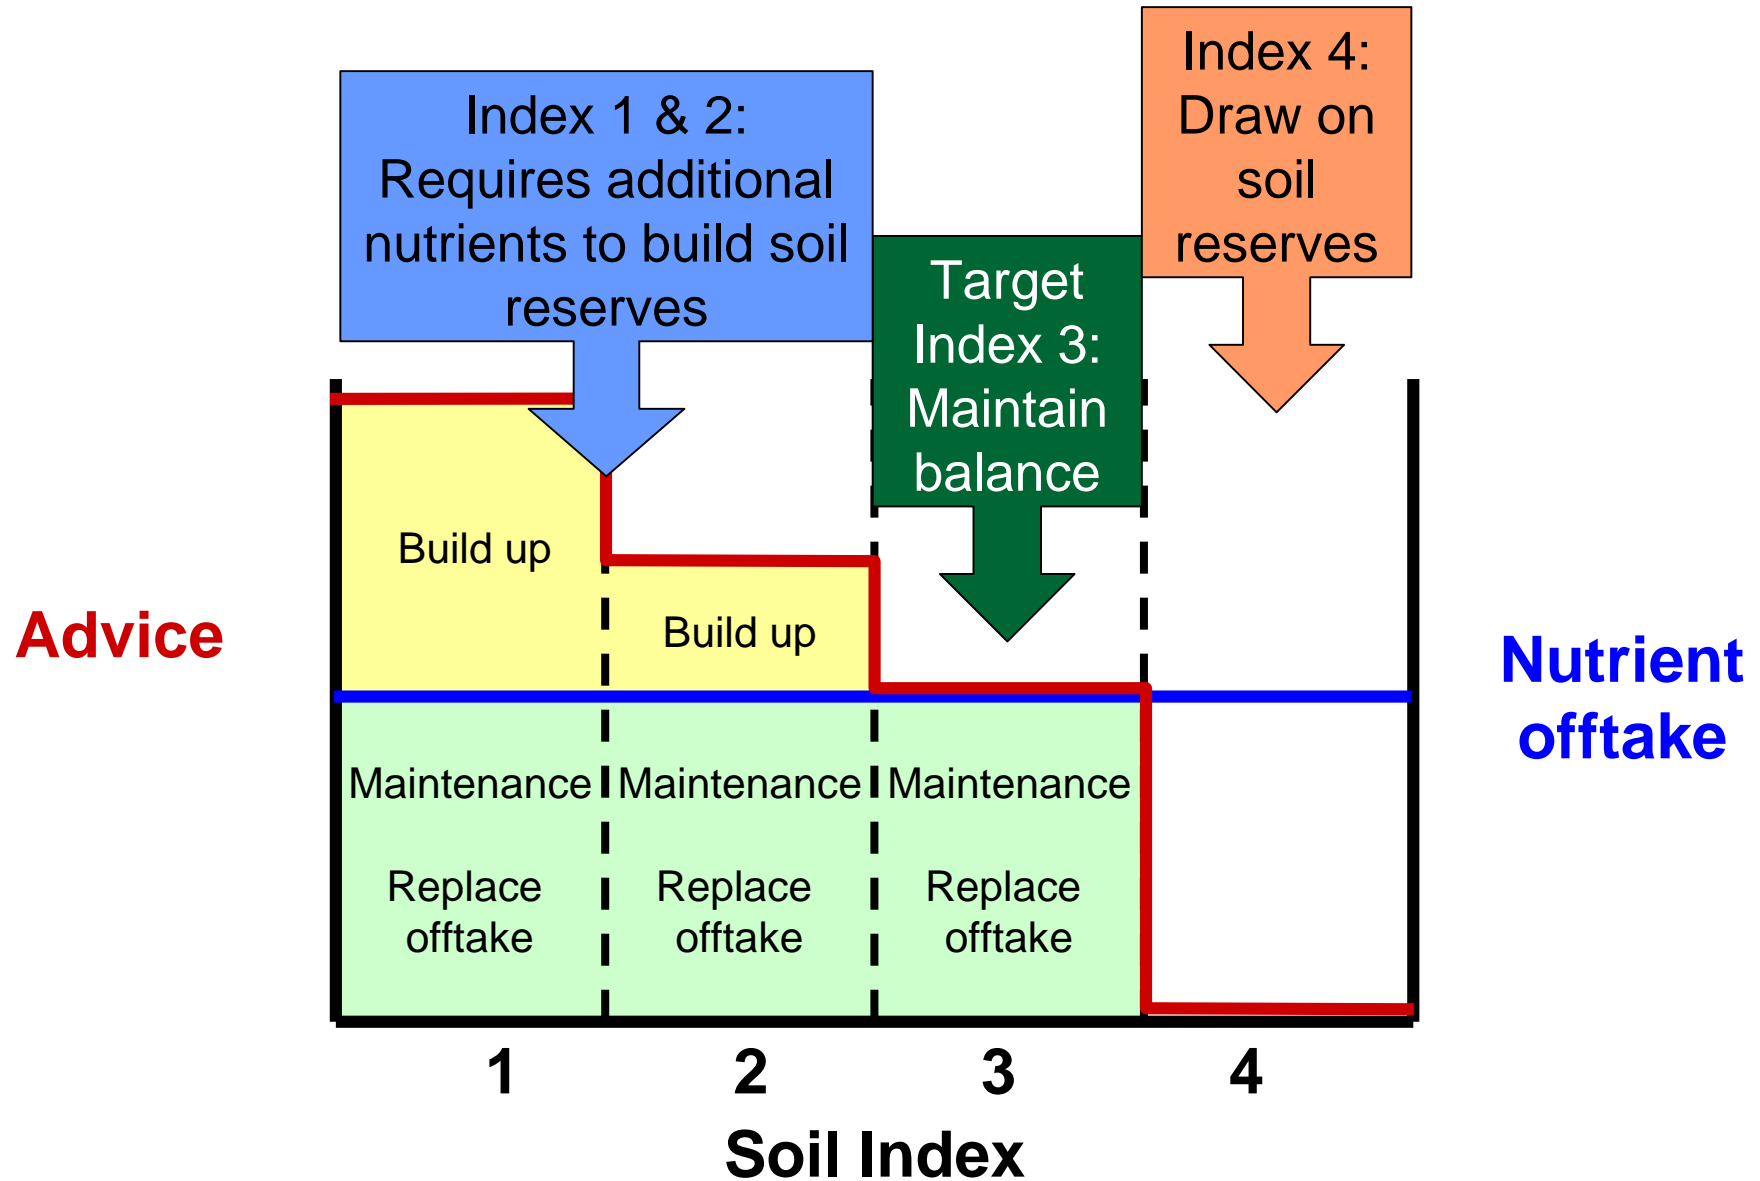

# P & K

- Convert test result into soil Index
- Target = All soils in Index 3 for P and K !
  - Only ~ 25% at present

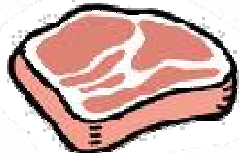

Soil Index	Description	Soil test P (mg L <sup>-1</sup> )	Soil test K (mg L <sup>-1</sup> )
1	Very low	0 – 3.0	0 – 50
2	Low	3.1 – 5.0	51 – 100
3	Medium	5.1 – 8.0	101 – 150
4	High	≥ 8.1	≥ 151

# Soil Index & Advice

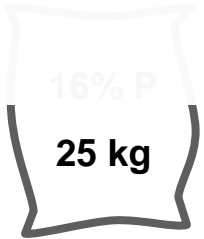

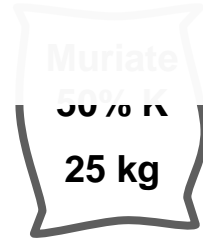

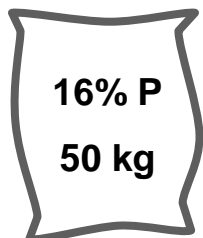

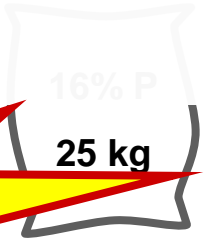

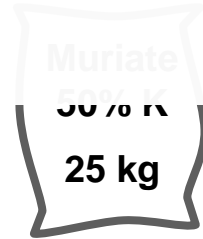

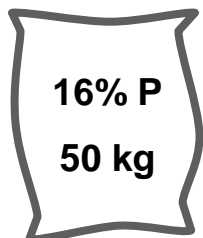

# Maintenance rates – P & K offtakes

	P (kg)	K (kg)
Milk (1000 litres) 	0.9 - 1	1 - 1.5
Liveweight (100 kg) 	1	0.5 - 1
Silage (1 ton DM) 	3 - 4	25
Leaching (1000 mm rainfall)		~ 10

# Soil P and K build up - Grassland

	<b>P</b>	<b>K</b>
<b>Index 2</b>	10 kg/ha (8 units/acre) 	30 kg/ha (24 units/acre) 
<b>Index 1</b>	20 kg/ha (16 units/acre) 	60 kg/ha (48 units/acre) 

# Soil P and K build up - Grassland

	<b>P</b>	<b>K</b>
<b>Index 2</b>	10 kg/ha (8 units/acre) 	30 kg/ha (24 units/acre) 
<b>Index 1</b>	20 kg/ha (16 units/acre) 	60 kg/ha (48 units/acre) 

**Apply build up + maintenance in Index 1 and 2**

# Soil P and K build up - Grassland

	P	K
Index 2	<p>30 kg/ha (24 units/acre)</p> <p>16% P 25 kg</p>	<p>30 kg/ha (24 units/acre)</p> <p>50% K 25 kg</p>
Index 1	<p>30 kg/ha (24 units/acre)</p> <p>16% P 25 kg</p>	<p>60 kg/ha (48 units/acre)</p> <p>Muriate 50% K 50 kg</p>

**Apply for 5 years or until soil test shows increase**

# Steps to Soil Fertility Management

# Slurry Value → 1000 gallons = ??

Soiled Water

€ 5 / 1000 gals

Cattle Slurry (Splashplate)

€ 24 / 1000 gals

€ 26 / 1000 gals

Trailing Shoe

+ 3 units N  
/ 1000 gallons

In spring or  
summer

Pig Slurry

€ 28 / 1000 gals

FYM (1 ton)

€ 10 / ton

# Contribution to Slurry Value

## Cattle Slurry

- Majority of the value is in P and K
- Aim to get best use of both P and K in slurry
- Timing or method
  - No effect on P and K
  - Big effect on N

# Decisions with slurry

## 1. Where to spread

- P & K requirements
- Target fields with:
  - low soil P and K
  - High requirements (e.g. silage)

## 2. When to spread

- Maximise N availability
- Weather as important as season, but spring generally best
- Trailing shoe / bandspreader will also increase N value

# Steps to Soil Fertility Management

# Nutrient Balance – What is the Weakest Link ?

- Nutrient in shortest supply limits determines yield
  - Especially true with P and K
- Fertilizer Planning
  - Soil tests & Cropping
  - Slurry & fertilizers
    - Straight K
    - N-P products
    - N-K products

**Buy what you need**

**- Not what you're being sold !!**

---

# Return on investment

---

# Soil Testing – Cost / Benefit

- ~ 25% of soils are in Index 3
  - If no soil test and assume Index 3, then you are likely to be wrong in 75% of fields !!
- Cost
  - Consider relative to fertilizer cost?

= € 350-500 / tonne ???

# Save Money in Index 4 - Dairy

- Example
  - Dairy – 2 cows / ha
  - Index 3 advice (grazing) = 14 kg/ha P & 30 kg/ha K
  - Cost of P and K = €58 /ha
  
- Soil Test shows Index 4
  - Save €58 /ha/yr until drops to Index 3

# Lost production in Index 1 & 2 - Dairy

- Production loss in Index 1 vs. Index 3

- Approximately 1.5 t/ha/yr of grass DM
- Worth €400 /ha/yr

- Additional P and K for build up = 20 kg/ha P & 60 kg/ha K

- Additional Cost = €100 ha/yr until soil P / K increases
- Long-term investment – benefits of increasing to Index 3

# Soil Fertility Management Targets

- Have soil analysis for whole farm
- Soil pH between 6 and 6.5 in all fields
  - 6.0 – 6.2 where high Mo (grassland)
- P and K Index 3 in all fields
  - Index 4 is a resource → Exploit it
  - Index 1 & 2 should be increased to Index 3
- Optimise slurry first – then top up with fertilizer as required
- Nutrient inputs in proper balance
  - Fertilizer planning is key to this
